

What happens if we have an accident?

When complacency becomes an issue and safety awareness values aren't there, we become victims of incidents and accidents. When there is an unfortunate change in events that causes an incident or accident related to an overhead crane, we can help.

ACCIDENT INVESTIGATION

We meet with your site safety team and assist with the accident investigation. We can contribute to the investigation specifically involving the overhead crane, rigging, and with a scene recreation. Finding out why things went astray is the largest contributing factor in prevention.

DRAWING CONCLUSIONS

Once we draw a conclusion based on facts and the events leading up to the incident, we compile the chain of events in question and create a "specific incident awareness training" in a half day or full day course to help educate the operator, management and fellow workers in what had occurred and how we plan to prevent this from recurring. We believe that education is prevention.

EDUCATION

Once the training course outline has been established, we meet to discuss course content. Final editing and approval is implemented and presented to management as a course for final critique and changes. The course has evaluation sheets to be completed by all attendees.

The evaluations are then passed on to our training department for evaluation of the course content and the evaluation of the instructor. This helps ensure that we offer the very best to you and your employees.

In the past, we have had a great deal of success with this service. References are available upon request.

Our motivators at Dyna Crane are accident prevention, safety awareness, and "making the difference".
